DMOPC '15 Contest 1 P5 - Lelei and Dragon Scales

Lelei is surveying a large field made up of $W \times H$ cells.

A large battle involving dragons has taken place here, and as such there are scales from dragons strewn all about the field. As dragon scales are extremely valuable and fetch a high price, Lelei would like to collect as many as possible. However, a battlefield is a pretty dangerous place to be, so she can only risk spending enough time on it to pick up the scales in a rectangular subsection of the field with a total area **up to** N.

Given the distribution of scales on the field and the maximum N that Lelei has time for, can you help her determine how many scales she'll end up with if she chooses an optimal section of the field?

Constraints

Subtask 1 [10%]

$1 \leq W, H \leq 20$

Subtask 2 [15%]

$1 \leq W, H \leq 50$

Subtask 3 [25%]

$1 \leq W, H \leq 100$

Subtask 4 [50%]

$1 \leq W, H \leq 250$

Input Specification

The first line of input will contain 3 space-separated integers W, H, and N $(N \leq W \times H)$.
The next H lines of input will each contain W space-separated integers in the range $[0, 100]$.

Output Specification

A single integer, the maximum number of scales that Lelei can pick up.

Sample Input 1

```
5 5 4
0 0 0 0 10
0 5 0 1 2
2 0 3 7 1
8 9 0 1 3
1 5 2 3 7
```

Sample Output 1

```
23
```

Explanation

Lelei should explore the 2×2 bottom-left corner of the field, which would allow her to collect $8 + 9 + 1 + 5 = 23$ scales.

Sample Input 2

```
1 2 1
0
5
```

Sample Output 2

```
5
```

Explanation

Lelei only has time for 1 cell, so she should choose the one with 5 scales.
